

# Independent Systematic Search for Meteorological Journal Articles Mentioning “Spanish plume” Through August 13, 2023

## Scope, eligibility, and search method

The target was English-language, peer-reviewed journal literature published **on or before August 13, 2023**, containing the two-word phrase “**Spanish plume**” in the article itself. Capitalization was treated as immaterial, but the words had to occur together; occurrences confined to a bibliography or reference list were excluded. Eligible studies had to concern meteorology, atmospheric science, or a closely coupled meteorological hazard—such as meteorologically generated waves—and had to study European weather or European atmospheric conditions.

The requested sources were searched conceptually as follows:

| Source                             | Query specification                                  | Date and other limits                                                                  | Database-reported result count                                                                                                                                                 |
|------------------------------------|------------------------------------------------------|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Google Scholar                     | "Spanish plume"                                      | Publication on or before August 13, 2023; language and document type screened manually | <b>Not obtainable:</b> the Scholar results interface returned an access block rather than a reproducible results page or export                                                |
| Wiley/Royal Meteorological Society | Exact phrase "Spanish plume" in full text/all fields | First-published date on or before August 13, 2023                                      | <b>Not obtainable:</b> Wiley article pages could be recovered through indexed publisher results, but the Wiley search endpoint returned HTTP 403 rather than a count or export |
| AMS Journals Online                | Exact phrase "Spanish plume" in full text            | Publication on or before August 13, 2023                                               | <b>Not obtainable:</b> individual full-text records were accessible, but a stable exact-query result count was not exposed                                                     |

| Source                         | Query specification                                                                           | Date and other limits                                                             | Database-reported result count                                                                             |
|--------------------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Web of Science Core Collection | ALL=( "Spanish plume" ) ; a narrower reproducible alternative would be TS=( "Spanish plume" ) | Through August 13, 2023; English; Article/Review, followed by full-text screening | <b>Not obtainable:</b> the subscription search interface did not provide an accessible result set or count |

Consequently, this investigation cannot honestly reproduce the four database hit counts requested or claim that its captured records constitute every database record. The results below are an **independently reconstructed, primary-publisher-verified lower-bound corpus**. No articles were added from Schultz, Young, and Kirshbaum's later review or from its supplementary dataset; that paper was also ineligible because it was published in 2025.

Searches of indexed publisher pages were iterated by publisher, journal family, publication period, and title fragments. Wiley/RMetS and AMS articles were verified against their own publisher records. Other candidates surfaced through exact-phrase searches leading to primary pages at Elsevier, Springer, Copernicus, and MDPI. Examples of directly visible in-text occurrences include AMS records describing Spanish-plume environments in European thunderstorm studies, Wiley records discussing Spanish-plume events in UK climatologies, and Copernicus records explicitly applying the term to European lightning, hail, and mesocyclone environments. <sup>2</sup>

## Screening totals and study flow

The accessible reconstruction produced **61 unique candidate records after manual deduplication**. A raw pre-deduplication total cannot be supplied because the four requested platforms did not yield exportable result sets: repeated publisher and web-index searches frequently returned the same article, but not in a form permitting a defensible automated duplicate count.

Of the 61 unique candidates screened:

| Screening stage                                                  | Records   |
|------------------------------------------------------------------|-----------|
| Unique candidates after deduplication                            | <b>61</b> |
| Excluded after title, metadata, and occurrence-context screening | <b>21</b> |
| Independently verified as eligible                               | <b>40</b> |

The database/publisher distribution of the 40 included records was:

| Independently verified source                                    | Eligible records |
|------------------------------------------------------------------|------------------|
| Wiley/Royal Meteorological Society full-text or publisher record | <b>18</b>        |
| AMS Journals Online full-text or publisher record                | <b>10</b>        |

| Independently verified source                                    | Eligible records |
|------------------------------------------------------------------|------------------|
| Other primary publisher pages reached by exact-phrases searching | <b>12</b>        |
| Total                                                            | <b>40</b>        |

These figures are counts of **verified included records**, not substitutes for the inaccessible database-reported query counts. Google Scholar and Web of Science indexing could not be tested record by record through their native interfaces.

## Eligible articles

Author lists are abbreviated with “et al.” where the publisher record contains a long consortium-style list. The final column reports the source through which the occurrence was independently verified; it does not infer Google Scholar or Web of Science membership where their native result sets could not be inspected.

| Title                                                                                           | Authors                                                              | Year | Journal                        | DOI or stable identifier                         | Date<br>source<br>actually<br>verified |

S. Grahame | 2023 | <i>Weather</i>                              | 10.1002/wea.4370         | Wiley                                |

The two latest inclusions whose dates required particular attention were Lewis et al., published on **July 17, 2023**, and Hayward et al., first published on **May 30, 2023**; both precede the August 13 cutoff. <sup>43</sup>

## Exclusions

Within the 61-record reconstructed candidate pool, **21 records were excluded**. Reasons were assigned hierarchically, using the first decisive reason.

| Primary exclusion reason                                                                     | Records  | Typical examples                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Published after August 13, 2023                                                              | <b>7</b> | The Heathrow hazardous-weather study was first published after the cutoff; later 2024–2026 derecho, atmospheric-desert, and Spanish-plume papers were likewise excluded. <sup>44</sup> |
| Book, thesis, conference item, training material, website, or other non-peer-reviewed source | <b>6</b> | A doctoral thesis, Met Office explanatory pages, educational material, and conference or operational documents were excluded irrespective of meteorological relevance. <sup>45</sup>   |

| Primary exclusion reason                                               | Records | Typical examples                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phrase visible only in the reference list or citing-literature display | 3       | Several Wiley results exposed “Spanish plume” solely through a cited Morris, Webb, or Sibley reference; without an independently visible body-text occurrence, they were excluded. The 1995 southeast-England storm paper is an example where the retrieved occurrence was in the reference display. <sup>46</sup> |
| Weather or case study outside Europe                                   | 2       | The two prefrontal-trough papers on southern Australia contained the phrase but failed the European-weather criterion. <sup>47</sup>                                                                                                                                                                               |
| Nonmeteorological subject despite phrase occurrence                    | 2       | Literary or cultural uses and unrelated pollution-plume studies were excluded. <sup>48</sup>                                                                                                                                                                                                                       |
| Non-English article                                                    | 1       | A non-English European storm account was removed under the language criterion.                                                                                                                                                                                                                                     |
| Total exclusions                                                       | 21      |                                                                                                                                                                                                                                                                                                                    |

A particularly conservative decision was made for articles whose search result showed the target phrase only among references or “citing literature.” Such records were not assumed to contain the phrase in the main text. This reduces false inclusions but may produce false exclusions where inaccessible full text contained an additional occurrence.

## Interpretation, completeness, and reproducibility

The independently verified corpus contains **40 eligible articles spanning 1986–2023**. It shows three broad phases: early operational and case-study usage in *Meteorological Magazine*, *Weather*, and AMS journals; a substantial expansion into European convective climatology and synoptic classification after 2010; and later use in lightning, hail, heat, meteotsunami, forecasting, and hazard-climatology research. The records demonstrate that the term was used both for individual European events and for generalized European atmospheric environments. <sup>49</sup>

The strongest reproducibility limitation is not the screening procedure but **database access**. A systematic-review claim of “all articles” normally requires preserved database exports, native hit counts, duplicate identifiers, and full-text verification for every record. Here, Google Scholar and Web of Science did not provide accessible native result sets, while Wiley’s exact-search endpoint blocked retrieval even though individual publisher records remained discoverable. The correct interpretation is therefore:

**Forty articles were independently identified and verified as eligible; this is a documented lower bound, not a demonstrably exhaustive census of every Google Scholar or Web of Science record.**

The requested four-source search could be made fully auditable only by rerunning the stated queries in authenticated or institutionally licensed interfaces, exporting every result with database identifiers, and

reconciling those exports against this 40-article corpus. No Schultz et al. article list, review table, or supplementary dataset was used to populate the eligible-paper table above.
